### Highlights

Matteo Castiglioni is an assistant professor (RTT) at the Department of Electronics, Information, and Bioengineering of Politecnico di Milano. His research focuses on artificial intelligence, algorithmic game theory and online learning. In particular, his research aims to combine machine learning techniques with economic paradigms to build strategic agents able to act in complex multi-agent environments. He got his PhD in Information Technology with laude from Politecnico di Milano with a thesis on asymmetric-information games and Bayesian persuasion under the supervision of Nicola Gatti. His Phd thesis was awarded the *Premio Cadoli*, awarded by AlxIA to the best Italian PhD thesis on artificial intelligence, and the Chorafas Award, awarded by the Dimitris N. Chorafas Foundation. He is the author of more than 70 peer reviewed research papers. In particular, he published in the premier AI journals such as *Artificial Intelligence* (8), and in the premier AI conferences ICML (13), NeurIPS (13), EC (7), AAAI (6), ICLR (6), IJCAI (4). He serves as a program committee member in several top-tier conferences. He teaches a M.Sc. course on online learning at Politecnico di Milano. He also taught several courses at BSc and PhD level. He participated in several industrial and research projects, assuming the position of principal investigator in some projects. Currently, he is co-PI of a research unit in the “ELIAS” project funded by HORIZON-RIA.

## Research Interests

His research focuses on <i>Artificial Intelligence</i> , especially Algorithmic Game Theory, Allocation Problems and Incentives, Social Influence, and Online Learning.	
Algorithmic Game Theory	He is interested in the computational complexity of finding equilibria, and the development of efficient algorithm to compute equilibria both in full-information and online problems. In particular, his research focuses on the computation of equilibria in leader-follower games, Bayesian persuasion, and contract theory. Moreover, he is interested in the design of no-regret online learning algorithms for these problems.
Allocation Problems and Incentives	He is interested in the design of incentive compatible mechanisms for allocation problems, e.g., auctions, and on the design of utility-maximizing algorithms for a single agent that takes part to these mechanisms, e.g., bidders in auctions. His research mainly focuses on the design of efficient bidding strategies in repeated auctions with long-term constraints, e.g., budget and return on investment constraints, using online learning algorithms.
Online Learning	He is interested in the design of online learning problems. In particular, his research focuses on the design of no-regret algorithms for game theory problems. Moreover, he is interested in online problems with uncertain long-term safety constraints.
